

# Dengue forecasting

## Model and challenges

Michael A. Johansson

Epidemic Analytics Unit, Dengue Branch, Division of Vector-Borne Diseases

San Juan, Puerto Rico

# Dengue – San Juan, Puerto Rico

week 8

week **16**

week **24**

week **32**

week **40**

# Evaluate forecasts on out-of-sample data (over multiple years for dengue).

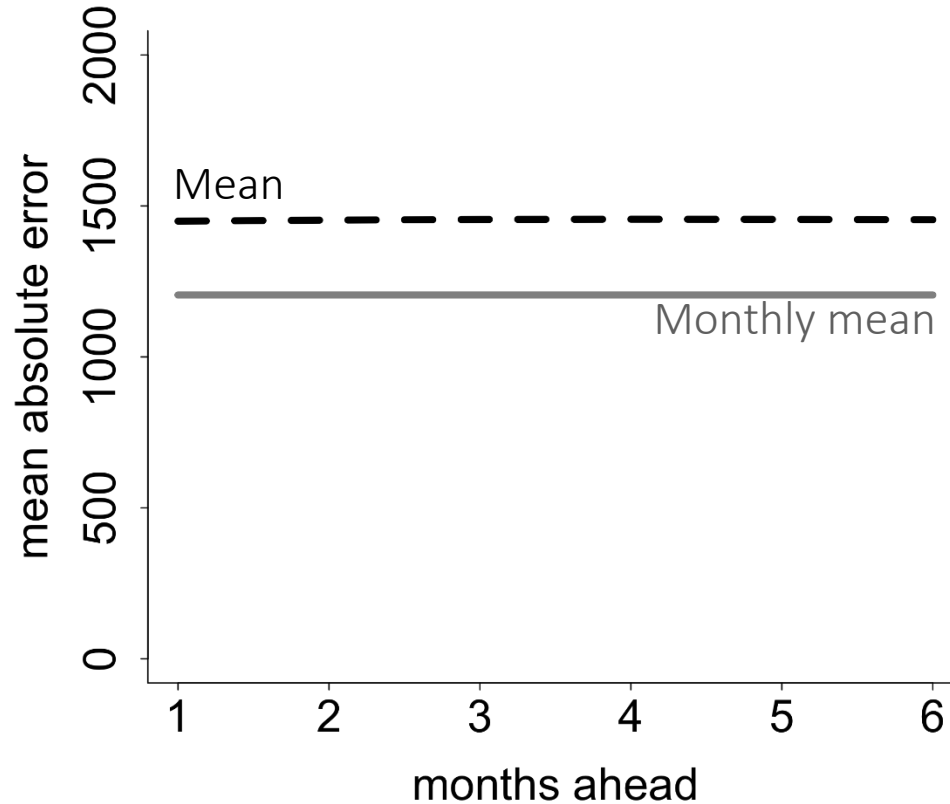

week **48**

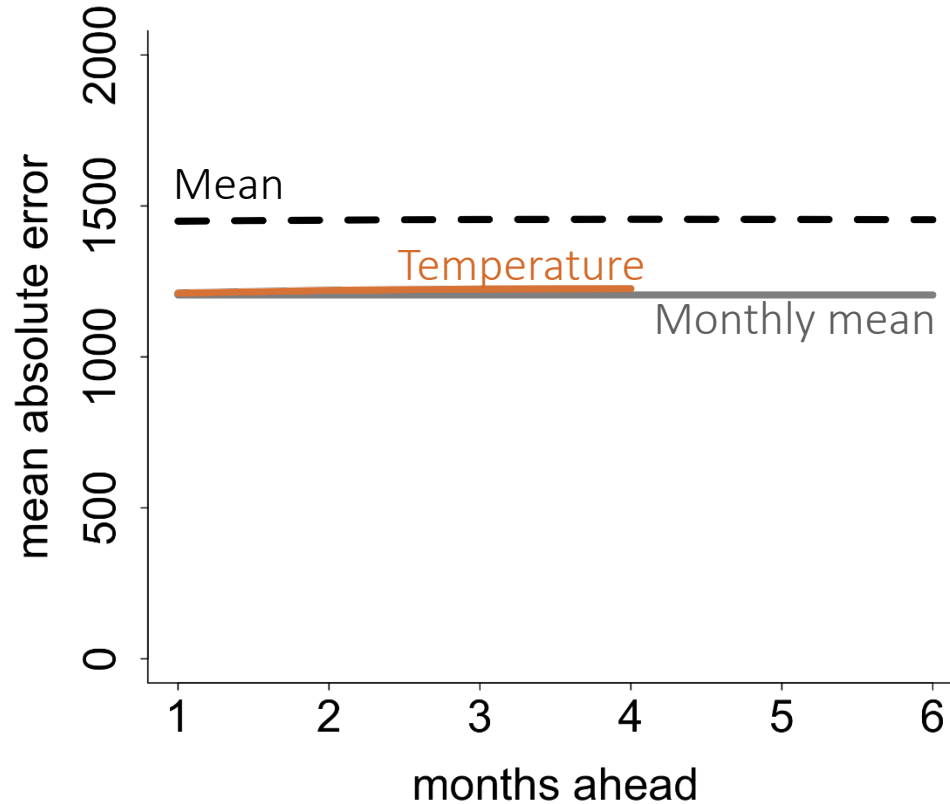

# Dengue forecast error - Mexico

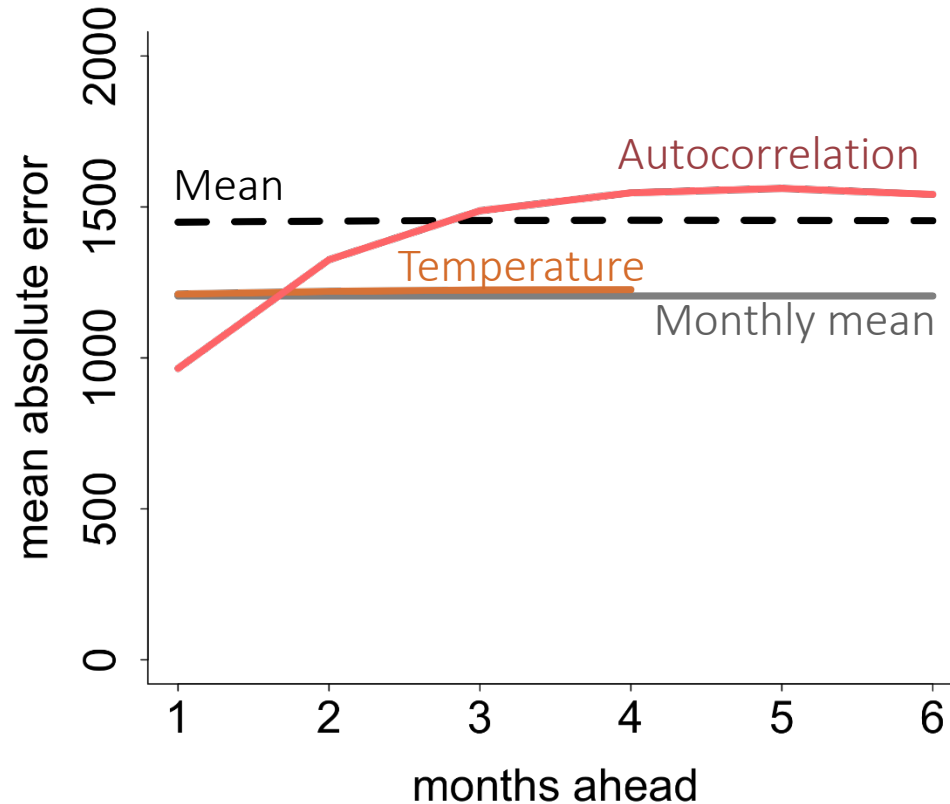

# Dengue forecast error - Mexico

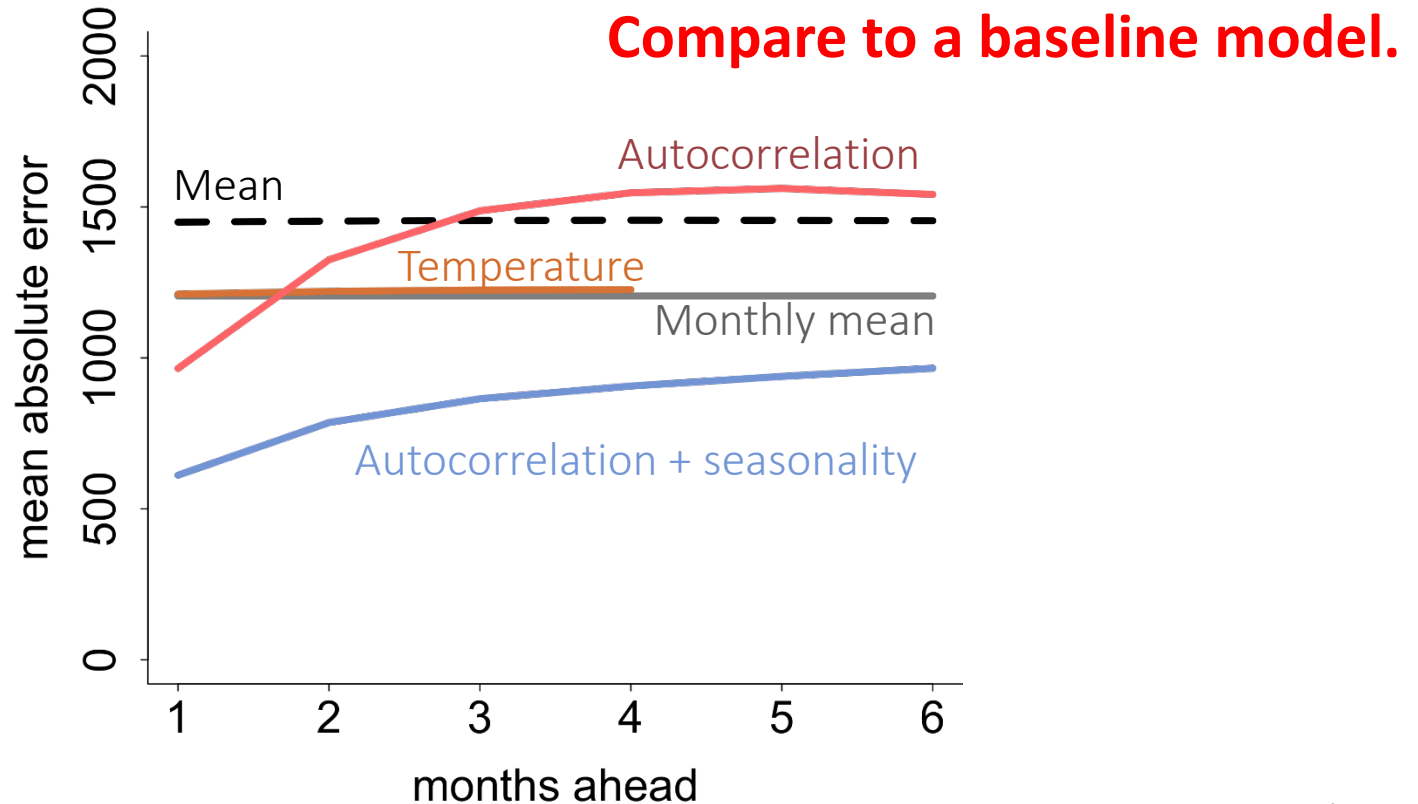

# Dengue forecast error - Mexico

# Dengue forecast error - Mexico

# Dengue forecast error - Mexico

# Forecasts - Mexico

**Assess the uncertainty.**

# BS Checklist for Forecasts

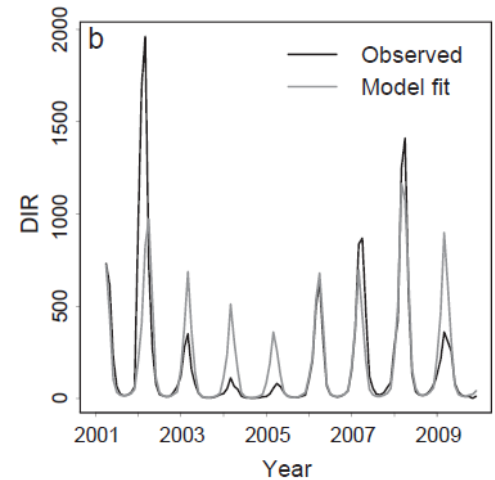

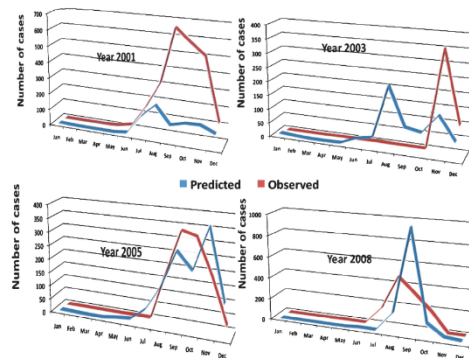

- Evaluate forecasts on out-of-sample data.
- Compare to a baseline model.
- Assess the uncertainty.

# Dengue forecasting research

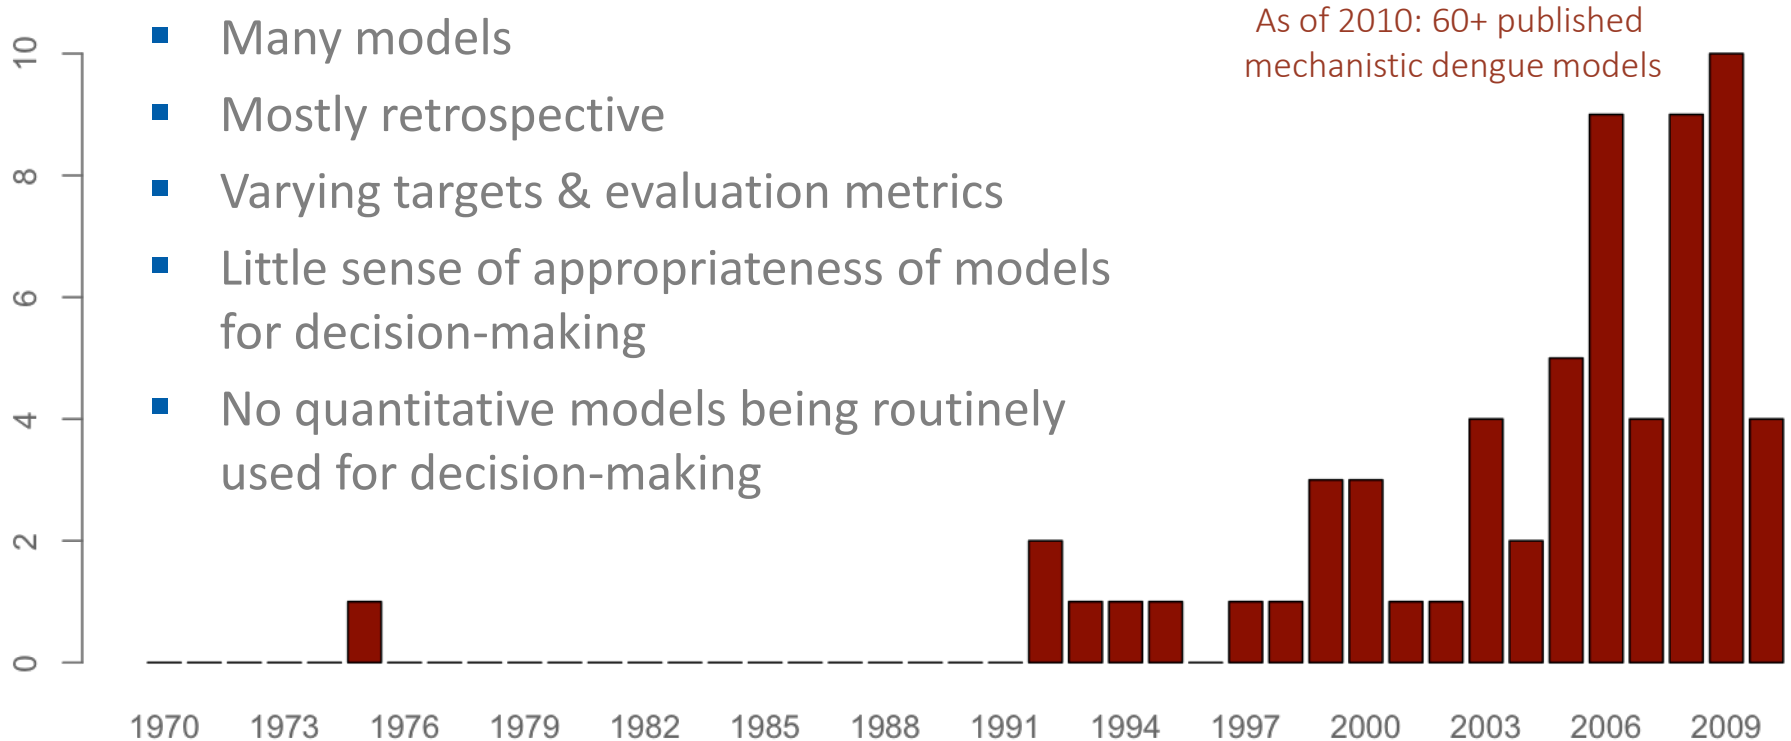

“[poor prediction was] the result of the unusual behavior that occurred between 2009 and 2011”

# The state of dengue forecasting

- Many models
- Mostly retrospective
- Varying targets & evaluation metrics
- Little sense of appropriateness of models for decision-making
- No quantitative models being routinely used for decision-making

# Dengue Forecasting Project

- Pandemic Prediction & Forecasting Science & Technology Working Group
- June–September, 2015
- Targets: Peak week, peak incidence, and total incidence over 8 seasons in Iquitos, Peru and San Juan, Puerto Rico
- 16 teams; 10,000 forecasts
- [dengueforecasting.noaa.gov](http://dengueforecasting.noaa.gov), [predict.cdc.gov](http://predict.cdc.gov)

# Correlation of point forecasts is not enough

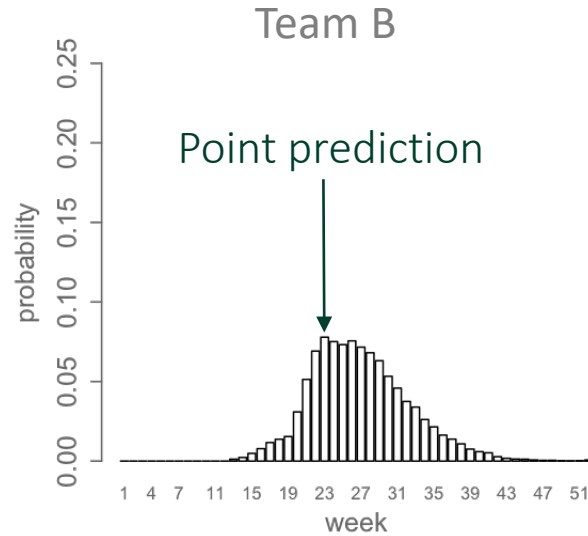

We need to assess both accuracy and confidence (i.e. certainty/uncertainty).

# Error metrics are simple and straightforward

	Forecast Peak Week	Observed Peak Week	Error (weeks)
Team A	23	32	9
Team B	23	32	9
Team C	22	32	10

# Probabilistic forecasts have more information

# Assessing probabilistic forecasts

$p = 0.02$

$p = 0.04$

$p = 0$

# Forecast calibration

Well-calibrated

Over-confident

Under-confident

No confidence

No resolution

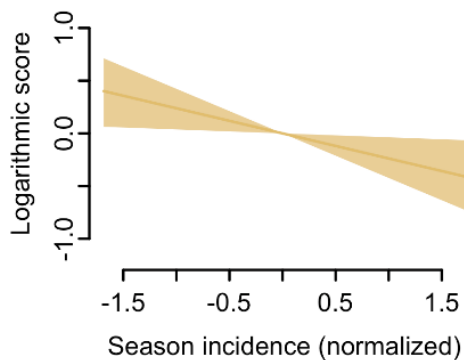

# Week 12 forecast for San Juan 2012/2013

# When are forecasts best?

~12,000 forecasts

- 2 locations
- 8 seasons
- 19 models

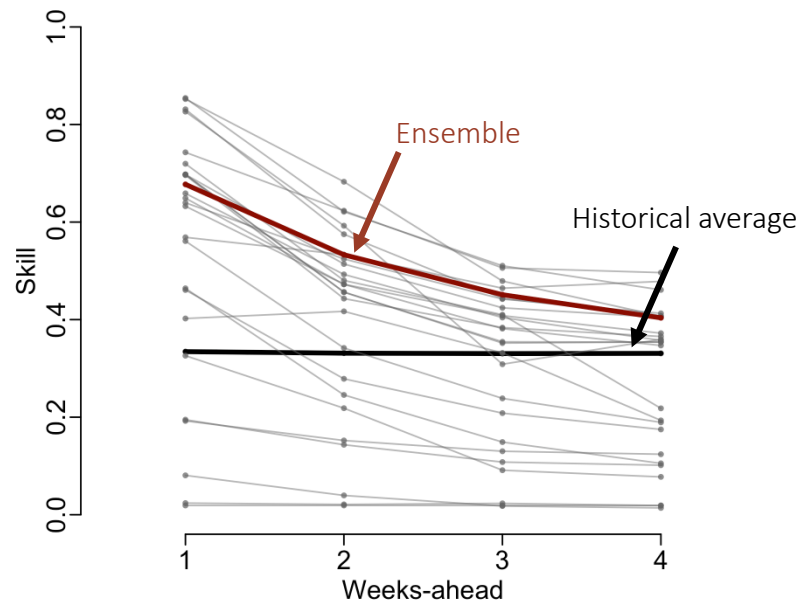

# Nowcast/situational awareness

SEASONAL DENGUE  
Peak week forecasts

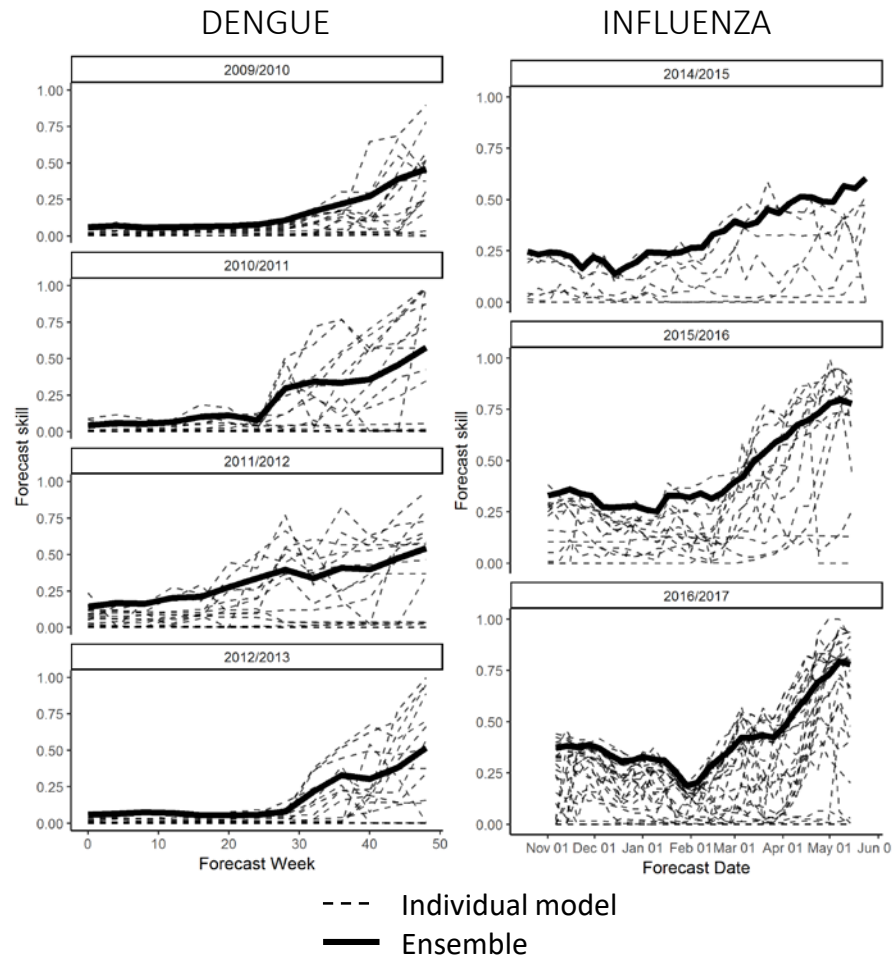

SHORT-TERM INFLUENZA  
1- to 4-week ahead forecasts

# Promising approaches

- Simpler models
  - No climate data (dengue)
  - No vector model (dengue)
- Ensembles
  - Simple ensembles (across targets, seasons, & diseases)
  - Prospectively defined
  - Current standard for influenza (since 2017/18)

# Key questions

- What are the key surveillance data?
- How much do vectors matter?
- What is the contribution of weather?
- What is the role of immunity and enhancement?
- What is the role of mobility and spatial heterogeneity?

# Conclusions

“Dengue is a disease of the tropical and subtropical regions, and within these zones it has a marked preference for the hot season - for summer.”

- Hermann Nothnagel, 1905

“It is difficult to make predictions, especially about the future.”

### NHC Official Annual Average Track Errors Atlantic Basin Tropical Storms and Hurricanes

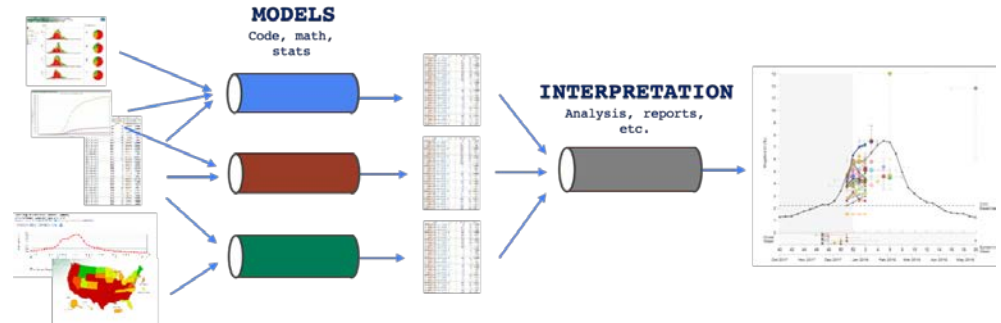

# How can infectious disease forecasting improve? (How has weather forecasting improved?)

- Data
- Analytical tools
- Computational power
- Evaluation
- Standardization & interoperability

# CDC Epidemic Prediction Initiative

- Connect researchers to data
  - Dengue, influenza ([github.com/cmu-delphi/delphi-epidata](https://github.com/cmu-delphi/delphi-epidata)), Zika ([github.com/cdcepi/zika](https://github.com/cdcepi/zika))
- Develop an analytical pipeline
  - [predict.cdc.gov](https://predict.cdc.gov)
  - Current: Influenza, *Aedes*
- Build a community
  - Centers for Disease Control and Prevention, Researchers, Multiple US Departments & Agencies, Council of State and Territorial Epidemiologists

# Conclusions

- Surveillance and forecasting go hand in hand.
- Current forecasting methods improve upon expert knowledge and can be helpful for situational awareness.
- Improved analytics can improve our ability to predict and respond effectively to arboviral disease epidemics.

# Key considerations

- Connect forecasts to decision making needs.
- Evaluate forecasts on out-of-sample data.
- Compare to a baseline model.
- Assess the uncertainty (including calibration).
- Use more than one model.
- Use forecasts as one input for decision making.
